antibody or its antigen-binding portion, and a targeting agent. The antibody specifically binds to an antigen in a protein that binds to antibody specifically binds to an antigen in a protein that binds to surface protein that activates the phosphatidylinositol-3-OH kinase (P13K) signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeting delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rheumatoid arthritis, cancers, cardiovascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence represents a fusion protein with mouse DAV-1 antibody heavy chain. (Updated on 23-OCT-2003 to standardise OS field) present invention relates to a bifunctional molecule comprising an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          8
                                       The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody or its antigen-binding portion, and argetting agent where the integrin, and the targetting agent specifically binds to a call surface protein that activates the phosphatidylinositol 3 (PISK) signalling pathway. The bifunctional molecules are useful for gene therapy, for promoting Adenoviral (Ad) vector-mediated gene delivery to calls lacking at integrins, for enhancing Ad binding and internalisation, and in gene delivery of by fibreless adenovirus particles. The bifunctional molecules permit targetting of viral and bacterial vectors to cells that express targetted receptors. Diseases that can be targetted include cancers, vascular disorders, hyperproliferative disorders, and hormonal disorders. The bifunct of the present sequence is human penton base monoclonal antibody, DAV-1 heavy
                                                                                                                                                                                                                                                                             14;
                                                                                                                                                                                                                                                                                                                                                                                                                                         240

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targeting agent. The alpha integrin, and the targeting agent specifically binds to an antigen in a protein that binds to alpha integrin, and the targeting agent specifically binds to a cell surface protein that activates the phosphatidylinositol-3-OH kinase (PISK) signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeting delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rheumatoid architits, cancers, cardiovascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence represents mouse DAV-1 heavy chain, penton base
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      14;

The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to avointed in a protein that binds to a cell surface protein that activates the phosphatidylinositol 3 (PI3K) signalling path bifunctional molecules are useful for gene therapy, for pathway. The bifunctional molecules are useful for gene therapy, for promoting Adenoviral (Ad) vector-mediated gene delivery to cells lacking a vintegrins, for enhancing Ad binding and internalisation, and in gene delivery of by fibreless adenovirus particles. The bifunctional molecules permit targetting of viral and bacterial vectors to cells that express targetted receptors. Diseases that can be targetted include cancers, vascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence is human N-terminal DAV-1 heavy chain-mature epidermal growth factor (BGF) fusion protein which is used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 NOKFKDKATLITVDKSSTTAYMELRSLISEDSAVYYCARSTMITNYVMDYWGQGTSVTVSS 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targeting agent. The antibody specifically binds to an antigen in a protein that binds to alpha integrin, and the targeting agent specifically binds to a cell surface protein that activates the phosphatidylinositol-3-OH kinase (PISK) signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeting delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rheumatoid arthritis, cancers,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to avoid the targetting agent specifically binds to a cell surface protein that activates the phosphatidylinositol 3 (PI3K) signalling protein that activates the phosphatidylinositol 3 (PI3K) signalling path and protein that activates the phosphatidylinositol 3 (PI3K) signalling promoting Adenoviral (Ad) vector-mediated gene delivery to cells lacking avointegrins, for enhancing Ad binding and incernalisation, and in gene permit targetting of viral and bacterial vectors to cells that express targetted receptors. Diseases that can be targetted include cancers, vascular disorders, diaberic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence is human N-terminal DAV-1 heavy chain-mature insulin growth factor-1 (IGF-1) fusion protein which is used in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

434 CSVLHE 439 Nemerow GR, Li E; Sequence 438 AA; WO200204522-A2 07-MAY-2002 17-JAN-2002 AAE18372; Query Match Best Local S AAE18372 RESULT 35 AABI8372 XXX AABI AAB g 8 14; The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targeting agent. The antibody specifically binds to an antigen in a protein that binds to alpha integrin, and the targeting agent specifically binds to a cell surface protein that activates the phosphatidylinositol-3-OH kinase (PISK) signalling pathway. The bifunctional molecules are useful for targeted gene therapy using targeting delivery vectors, such as adenoviral gene delivery particles. The bifunctional molecules are useful for treating viral infections, rheumatoid arthritis, cancers, cardiovascular disorders, diabelic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence represents a fusion protein with mouse DAV-1 antibody heavy chain. The present invention relates to a bifunctional molecule comprising an antibody or its antigen-binding portion, and a targetting agent where the antibody specifically binds to an antigen in a protein that binds to avintegrin, and the targetting agent specifically binds to a cell surface protein that activates the phosphatidylinositol 3 (PI3K) signalling pathway. The bifunctional molecules are useful for gene therapy, for promoting Adenoviral (Ad) vector-mediated gene delivery to cells lacking av integrins, for enhancing Ad binding and internalisation, and in gene delivery of by fibreless adenovirus particles. The bifunctional molecules permit targetting of viral and bacterial vectors to cells that express
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 NQKFKDKATLITUDKSSTTAYMELRSLTSEDSAVYYCARSTWITNYYMDYWGQGTSVTVSS 120

                                                                                                                                                                                                                                                                                         Human, bifunctional molecule; monoclonal antibody; gene therapy; cancer; vascular disorder; diabetic retinopathy; restenosis; ophthalmic disorder; hyperproliferative disorder; hormonal disorder; DAV-1 heavy chain; cytostatic; vasotropic; ophthalmological.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 79
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New bifunctional molecules comprising an antibody or its antigen-binding portion, and a targeting agent, useful for e.g. gene therapy, or for promoting Adenoviral vector-mediated gene delivery to cells lacking av
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   targetted receptors. Diseases that can be targetted include cancers, vascular disorders, diabetic retinopathies, restenosis, ophthalmic disorders, hyperproliferative disorders, and hormonal disorders. The present sequence is human penton base monoclonal antibody, DAV-1 heavy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        20 BVQLQQSGPELVKPGASVKISCKASGYTFTDYNAHWVKQSHGKSLEWIGYIYPYKGGTGY

```
ention relates to a bifunctional molecule comprising an antigen-binding portion, and a targeting agent. The ically binds to an antigen in a protein that binds to an antigen in a protein that binds to an and the targeting agent specifically binds to a cell and the targeting agent specifically binds to a cell that activates the phosphatidylinositol-3-0H kinase ing pathway. The bifunctional molecules are useful for therapy using targeting delivery vectors, such as delivery particles. The bifunctional molecules are useful ral infections, rheumatoid arthritis, cancers, diabetic retinopathies, restenosis, ophthalmic disorders, diabetic retinopathies, restenosis, ophthalmic irrolliferative disorders, and hormonal disorders. The represents a portion of the mouse DAV-1 heavy chain that usion protein bifunctional antibody
                                                                                                                                                                                                                                                                                                                                                      olecules comprising an antibody or its antigen-binding geting agent, useful for e.g. gene therapy, or for al vector-mediated gene delivery to cells lacking av
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              16; 49pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence represents the light chain of the antibody ABX-CXL. The invention relates to a monoclonal antibody (MAD) with an isotype that itses complement and a variable region that binds to the epitope on CD147 bound by the IgM MAD ABX-CBL, providing that the antibody is not CB14. The MAD can selectively kill activated T-cells, activated B-cells or resting or activated monocytes. The products and methods can be used for treating diseases involving activated T-cells or B-cells or monocytes, e.g. graft versus host disease (GVHD), organ transplant, rejection diseases (e.g. renal transplant, cancers (e.g. cancers of the blood (e.g. lupus), and inflammatory diseases (e.g.

The CDNAs were incorporated into a Ti plasmid vector, which was incorporated into A. tumefaciens. The mesultant plant expression vector was used to transform tobacco plants, and making them TMV resistant, the plants could also be biofarmed for the prodn. of anti-virus antibodies

The present invention describes a hybrid polypeptide (I) comprising: (a) a polypeptide motif containing a sufficient number of contiguous amino acid residues from a polypeptide associated with a disease of protein aggregation or conformation to bind an aggregating form of the polypeptide or to a disease-associate conformer of the polypeptide; and (b) an additional amino acids from a polypeptide other than the

```
polypeptide from which the motif is derived, where the resulting hybrid polypeptide binds with greater affinity to a disease causing or infectious conformer of the polypeptide that is the source of the polypeptide that is the source of the polypeptide motif compared to a benign form of the polypeptide. Also described: (1) a nucleic acid molecule encoding (I): (2) a vector comprising the nucleic acid molecule encoding (I): (2) a vector of polypeptide associated with a disease of protein aggregation; in a sample constraint supporting a plurality of polypeptides described above; (6) detecting cells that contain a protein aggregation; in a sample contain supporting a plurality of polypeptides described with a disease of protein aggregation; (7) preparing a hybrid molecule that specifically interacts with one conformer of a protein involved in the disease mentioned above; and (8) an anti-idiotype antibody that specifically binds to an infectious form of a protein involved in the disease mentioned above; and (8) an anti-idiotype antibody that specifically binds to an infectious form of a protein involved in the disease mentioned above; and diabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidabetic, anticidation and methods of the present invention or associated with chronic inflammeroy disease, frye if disease, from the anticidation and methods of protein aggregation or associated with autosomal dominant inheritance of variant transthyretin gene, amyotrophic lateral sclerosis, pick's disease, protein anticidasis, familial amyloidosis, hereditary systemic and systemic anyloidosis, chronic inflammation, anticidasis, familial amyloidosis, chronic inflammation, anticidasis, cardiac and invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This amino acid sequence comprises an scFv, termed 5T4scFv.1, comprising the heavy chain variable region (VH) from the murine 5T4 monoclonal antibody followed by a 15-amino acid flexable linker and the light chain variable region (VL) of the mouse 5T4 antibody. The trophoblast call surface antigen defined by monoclonal antibody 5T4 is expressed at high levels on the cells of a wide variety of human tumours. 5T4scFv.1 DNA (see AAV86090) can be used to construct single-chain antibodies (see AAW86003) and scFv fusion constructs (see AAW86004-05). The invention relates to a vector comprising a nucleotide sequence coding for a tumour interacting protein (TIP) and optionally a nucleotide sequence of interest (NOI) which encodes a protein of interest (POI), the vector being capable of delivering the NOI and/or POI to the tumour recognised by the TIP. Delivery can be in vivo or ex vivo. The vector is used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New vector encoding a tumour interacting protein for treating cancer - contains a desired nucleotide sequence and/or protein which recognises tumours, and is used as a gene delivery system to treat cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                g
                                                                     ò
                                                                                                                                                                                                                                                          à
                                                                                                                                                                                                                                                                                                                                                                                                                                                           This sequence represents a single chain FV (ScFV) sequence. The invention relates to a method for isolating a gene encoding a membrane-bound protein, comprising introducing a vector into a cell, contacting an antigen with the cell expressing the fused protein encoded by the vector on its surface to select an antigen-binding cell, and isolating the offer vector contains DNA encoding a secretable functional protein with antigenicity and antigen-binding a secretable functional protein with antigenicity and shiding affinity, and a cDNA ligated to DNA downstream of the 3' end of the coding sequence. The method can be used to isolate a membrane-bound protein for diagnosis and study. It can also be used for producing drugs treating abnormal functions of the protein. Such a technique is efficient and selective, which is different from the priorant inansmembrane trap (TMT) method wherein an epitope recognised by an antibody is carried in a fused protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            119

This sequence represents an example of a secreted single chain antibody
Fy fragment (in this case, directed against the 5T4 antigen), which is
involved in transculular localisation. A secreted single chain antibody
Fy fragment can be fused to cytochrome P450 reductase (P450R) derivatives
such as anchorless P450R (AAY42287) or FN fragment (AAY42288). This
chains the fusion protein to be delivered to other cells where it is
then transported to the nucleus. Many drugs' sites of action are in the
nucleus, rather than the cytoplasm, where P450R normally functions. P450R
or its derivatives can be used to activate prodrugs to their active form
via reduction. Administration of a prodrug is useful where the active
drug may be metabolised before it reaches its site of action or where the
active drug is cytotoxic, e.g., anticancer drugs. Targetted delivery of
such prodrug activators allows a reduction in dose of the prodrug, and
thus of systemic side-effects. P450R derivative fusion proteins, or
vectors that express them, are specifically used to treat tumours,
inflammation, atherosclevosis and muscular dystrophy, but may also
seed to treat many other conditions, e.g., cerebral malaria, rheumatoid
architis, or conditions associated with hypoxia, ischaemia or
hypoglycemia, or to deliver antiblotics, antiviral agents, analgencs,
anaesthetics, anti-inflammatories, antineoplastic agents and diagnostic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        134

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a new prodrug activating agent that comprises: (1)

a localization domain (ED) other than a tumor-selective antibody) and a
prodrug activating domain (EDA); (11) at least.one nucleic acid encoding
a cytochrome P450 and under control of at least one constitutive or
inducible expression control sequence or (iii) a modified hematopoietic
stem cell (MHS) containing at least one nucleic acid encoding a PAD and
under control of elements as in (ii). The prodrug activating agent or
vectors that express them, are specifically used to treat tumors,
inflammation, atherosclerosis and muscular dystrophy, but may also be
used to treat many other conditions, e.g. cerebral malaria, rheumatoid
arthritis, or conditions associated with hypoxia, hypoxia, hypoxia, atheumatoid
arthritis, or to deliver antibiotics antiviral agents, analgesics,
ischemia, or to deliver antibiotics antiviral agents, analgesics,
capents. LD optimize activity of PAD, e.g. by delivering it to selected
locations or by delivering it to neighboring cells (bystander effect),
and allow a readuction in dose of prodrug, and thus of systemic side.
effects. Nucleic acids encoding the agent may be expressed selectively in
hypoxic cells. The present sequence represents the single chain variable
antibody fragment against the tumor antigen 574 (574 scFv) is
                                                                                                                                                                                                                                                                                                                              product, accountantion domain; tumor-selective antibody; cytochrome P450; prodrug activating domain; modified hematopoietic stem cell; MHSC; tumor; fillammation; atherosclerosis; muscular dystrophy; cerebral malaria; rheumatioid arthritis; hypoxia; ischemia; hypoglycemia; tumor antigen; 574 scfv.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a peptide ligand with specific affinity for the p24 protein of human immune deficiency virus-1 (HIV-1) comprising at least one peptide strand corresponding to the N-terminal region of the light and/or heavy chain of the Fab fragment of monoclonal antibody 1385 in which: (i) the light chain includes three hypervariable regions (HVR) at amino acid (aa) positions 24-33, 49-55 and 88-95 of AAY4175; and (ii) the heavy chain includes three HVR at as positions 26-35, 49-65 and 99-109 of this sequence. The peptide ligands are reagents for detecting p24 (by standard immunoassays) in biological samples, specifically for diagnosis of HIV-1 infection or can be used to treat HIV-1 infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CKASQSVSNDVAWYQQKPGQSPKLLISYTSSRYAGVPDRFSGSGYGTDFTLTISSVQAED

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The Scrv antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or for adjuvant treatment of a disease. The Scrv antibody is also useful for treating inflammatory diseases including arthritis, hypersensitivity, autoimmune diseases, cancers, central nervous system disorders including Parkinson's disease, periodontal diseases, cardiovascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases, gastrointestinal disorders, infections, diabetes, Helicobacter-
related diseases, and other immune disorders. The present sequence
represents a 574 ScFv of the invention. The antibody comprises the VH and
VL regions from murine 574 monoclonal antibody, joined by a linker
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the amino acid sequence of B7-1.5T4.1, a fusion protein comprising the extracellular domain (amino acids 1-215) of buman co-stimulatory molecule B7-1 joined via a flexible peptide linker to an scrv (see AAW86002) derived from murine 5T4 monoclonal antibody. B7-1.5T4.1 of the fusion protein in mammalian cells. The trophoblast cell surface antigen defined by 5T4 is expressed at high levels on the cells of a wide variety of human tumours. The invention relates to a vector comprising a nucleotide sequence ocding for a tumour interacting protein (TIP) and optionally a nucleotide sequence of interest (NOI) which encodes a protein of interest (POI), the vector being capable of delivering the NOI and/or POI to the tumour recognised by the TIP Delivery can be in vivo or ex vivo. The vector is used to treat cancer, and may also used as a gene delivery system for introducing at least 1 gene encoding a TIP (Tie expected to bind specifically to CD28 and CTLA-4 present on human realls

                                                                                                                                                                        ò
                                                                                                                                                                                                                                                                                                     The specification describes the use of a single chain antibody (ScFv), which is capable of recognizing a disease associated molecule in the manufacture of a medicament for the prevention and treatment of a disease condition. The ScFv antibody is useful in the manufacture of a medicament, for affecting a disease in vivo, for preparing a pharmaceutical composition, for in vivo imaging and/or-for adjuvant treatment of a disease. The ScFv antibody is also useful for treating inflammatory disease. The ScFv antibody is also useful for treating diseases, cancers, central nervous system discases; carcinionary diseases, carcinolary diseases, cardiopulmonary diseases, cardiovascular diseases, and other immune disorders. Inflating parkinson's diseases, and other immune disorders. The present sequence represents a B7-1.574.1 tusion protein. This comprises the N-terminus of the 574 ScFv is fused after amino acid 215 of human B7-1

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I will make a particularly useful for treating or preventing myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, myeloma, colon cancer, gastric cancer, adenocarcinoma, sarcoma, melanoma, treating the above mentioned diseases. This sequence represents an expessed protein tag (EPT) isolated from human tissue for translational specification but was obtained in electronic format directly from WIPO at the wipo int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Translational profiling, expressed protein tag; EPT; kinase; phosphatase; protease; protease inhibitor; transporter; cytoskeletal protein; reseptor; transcription factor; cancer; MHC; major histocompatability complex; myeloma; colon cancer; gastric cancer; adenocarchnoma; sarcoma; melanoma; lymphoma; leukaemia.

The invention describes a purified polypeptide, which comprises a fragment of a kinase, phosphatase, protease, protease inhibitor, transporter, cytoskeletal protein, receptor or transcription factor. The polypeptide is useful as an immunogenic composition for eliciting in a mammal an immunogenic response directed against any of the purified polypeptide. The purified polypeptide, or the antibody that binds to this polypeptide, is useful for treating cancer. The polypeptide is also useful for identifying compounds that binds to a naturally processed class I or class II MHC-binding polypeptide. The polypeptides and class I or class II MHC-binding polypeptide. The polypeptides and myeloma, colon cancer, gastric cancer, reating or preventing myeloma, colon cancer, gastric cancer, assenting agents for treating the above mentioned diseases. This sequence represents an treating the above mentioned diseases. This sequence represents an profiling. Note: This sequence does not appear in the printed sequence the contractive form with integral of the printed of the contractive form with the printed the contractive form with the printed contractive forms.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        121 AKTTPPSVYPLAPGSAAQTNSMVTLGCLVKGYFPEFVTVTWNSGSLSSGVHTFPAVLQSD 180

The present invention describes a polypeptide sequence comprising part or all of the primary structural conformation of one or more thyrotropin (TSH) receptor epitopes with which altoantibodies and/or lymphocytes produced in response to a TSH receptor interact. Also describeds and/or lymphocytes interact, as with the polypeptide sequence described above; (2) a method of screening for autoantibodies or lymphocytes produced in response to a TSH receptor in a sample of body fluid obtained from a subject supperfected of suffering from, susceptible to, having or recovering from autoimmune disease associated with an immune reaction to a TSH receptor; (3) a binding partner for a TSH receptor, which is capable of binding to a TSH receptor, which is capable of binding partner does not comprise the TSH receptor, which is capable of binding partner does not comprise TSH receptor, which is capable of binding partner does not comprise of stimulating thyroid tissue, and/or tissue containing a TSH receptor for simultaneous, separate or sequential use in stimulating thyroid tissue, and/or tissue containing a TSH receptor has cyclostatic activity and can be used in gene therapy. The polypeptide, compositions and methods from the present invention can be used for treating an autoimmune disease associated with an immune reaction to a TSH receptor. The specific binding partner is useful for the manufacture of a medicament for stimulating thyroid cissue or tissue containing a TSH receptor, and for treating thyroid concer. Acceptor and Acceptor, and for treating thyroid concer. Acceptor and Acceptor, and for treating thyroid cissue or tissue containing a TSH receptor, and for treating thyroid cissue or tissue containing a TSH receptor. The specific binding partner is useful for the manufacture of a medicament for treating thyroid cissue or tissue containing a TSH receptor, and for treating thyroid cissue or tissue containing a TSH receptor. TSH seceptor and Acceptor and Acceptor and Acceptor and Acceptor and Acceptor and Acceptor an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New polypeptide sequence having part or all of the primary structural conformation of one or more TSH receptor epitopes, useful for treating an autoimmune disease associated with an immune reaction to a TSH receptor, e.g. thyroid cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Thyrotropin receptor; TSH receptor; epitope region; antibody; autoantibody; autoimmune disease; thyroid tissue; cytostatic; gene therapy; immune reaction; thyroid cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              TSH receptor antibody 3C7 heavy chain amino acid sequence.

Also described: (1) one or more receptor TSH epitopes with which the autoantibodies and/or lymphocytes interact, as with the polypeptide sequence described above; (2) a method of screening for autoantibodies or lymphocytes produced in response to a TSH receptor in a sample of body fluid obtained from a subject suspeceed of suffering from, susceptible to, having or recovering from autoimmune disease associated with an immune reaction to a TSH receptor; (3) a binding partner for a TSH receptor, which is capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New polypeptide sequence having part or all of the primary structural conformation of one or more TSH receptor epitopes, useful for treating an autoimmune disease associated with an immune reaction to a TSH receptor,

binding partner does not comprise the large the binding partner does not comprise the first receptor; and (4) a combination comprising the binding partner and one or more further agains capable of stimulating thyroid tissue, and/or tissue containing a TSH receptor, for simulating thyroid tissue, and/or tissue containing a TSH receptor, for simulating thyroid tissue containing a receptor has cytostatic activity and can be used in TSH receptor has cytostatic activity and can be used in gene therapy. The polypeptide, compositions and methods from the present invention can be used for treating an autoimmune disease associated with an immune reaction to a TSH receptor. The specific binding partner is useful for the manufacture of a medicament for stimulating thyroid tissue or tissue containing a TSH receptor, and for treating thyroid cancer. ACC44917 to ACC44910 to ABP96719 to ABP96750 represent TSH receptor antibody VH and VL domains given in ABP96731 encode the TSH receptor antibody VH and VL domains given in ABP96778, which are used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                      The OK3T heavy chain sequence was deduced from the cDNA sequence isolated from a library prepared from OK3T producing cells. The library was screened with a probe complementary to a region in the mouse IgG2a constant domain region. The OK3T sequence was used in CDR-grafting experiments to prepare humanised antibodies. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 420
                                                                                                                                           New humanised antibodies comprising CDR grafted antibody - with heavy and light chains, for use in vivo therapy and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      301 ATSEYEGSSVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLTEEKKVPINLWIDGKQ 360

RESULT 55

AAR40385 standard; protein; 225 AA

```
A fragment of the heavy chain (VH + CH1) from the anti-snake small neurotoxin monoclonal antibody M(alpha)2-3 was PCR-amplified from neurotoxin monoclonal antibody M(alpha)2-3 was PCR-amplified from the same cource using primers AAQ48040.

C fragment (VL + CL) was amplified from the same source using primers AAQ48041 and AAQ48042. The two amplified fragments were inserted into the same vector; the H-chain fragment was inserted (in-frame) between codons of 7 of the phoA coding sequence and the L-chain fragment was inserted into a cassette which contained a phoA S-D sequence, a signal peptide and the first 6 codons of phoA. The cassette was positioned between the cermination codon and the transcription termination sequence of phoA. The fusion construct is expected to to encode a hybrid protein construct is expected to to encode a hybrid proteins containing two different Ab-derived units (i.e. to produce bispecific antibodies). When a toxic protein is used in place of phoA, the hybrid molecules can be used as cell-targetting therapeutic agents. (Updated on 10-MAR-2003 to add missing OS field.) The patent discloses new catalytic antibodies which hydrolyse amino acid esters enantioselectively. Preferably the esters are 4-nitro- benzyl esters and the seterida amino acids are amino-protected. Also disclosed are new hybridomas expressing the catalytic antibodies, especially zaa7312 (FERM BP-4947) and Zaa32 (FERM BP-4946). The antibodies are raised in mice using the compound p-nitrobenzyl (4-carboxyl-tenzyl) caycarbonylamino)-butyllphosphonate as hapten. They are used for efficient resolution of racemic amino acids with high optical selectivity, giving optically active amino acids useful for the production of optically active drugs and chiral separation agents. The present sequence represents the variable region of the heavy chain of antibody 7612, produced by the hybridoma ZaA7G12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      62 DKATLTADKSSTAYMQLSSLTSEDSAVYYCV------MKDYWGQGTSVTVSSAKTTP 113
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Catalytic antibody for enantioselective hydrolysis of amino acid ester(s) - also new hybridoma secreting the antibody.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        66 DKATLIVDKSSTTAYMELRSLISEDSAVYYCARSTMITNYVMDYWGQGTSVTVSSAKTTP

Synthetic polypeptides having structural homology to Staphylococcal axotoxins are claimed, provided the homology includes statistically significant sequence homology, alignment of Cysteine residues and similar hydropathy profiles. forms of the antigen. The antibodies generated can be used in the diagnosis, e.g. detection of the immunorecessive antigen, or in therapy e.g. of cancer, Alzhaimer's disease or familial hypercholesterolaemia. The method of production of the antibody allows rapid and sensitive isolation of antibodies that would be difficult to isolate by standard methods. The antibodies produced have greater binding affinity than those produced by combinatorial/hybridoma methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence of the heavy chain variable region from the mouse antibody PB3-2. This sequence was isolated from a variegated display library (VDI of variable regions derived from a repertoire of antibodies from an immunotolerised animal. The VDL is generated by PCR amplifying the variable regions from the antibody coding sequences using the primers AAQ74153-74. The variable regions, esp the complementarity determining regions (CDR, see AAR75462-93 for examples of CDRs) from the immunotolerant animals, antibodies are used to construct an antibody against a immunorecessive antigen e.g. a cell surface marker on a foetal cancer or stem cell, which can differentiate between variant or related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Generating new antibodies specific for immunorecessive epitopes - by selection from variegated V gene library cloned from immuno:tolerance derived antibody repertoire, useful in diagnosis, purifon. and therapy,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        61 NQKFKDKATLTVDKSSTTAYMELRSLTSEDSAVYYCARSTMITWY--VMDYWGQGTSVTV

                                                                                                                                      d
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequences given in AAR53802-05 represent the FAB light and heavy chains of F19.9 and IMCP. These FAB had the V-min protein ligated into them to form a conjugate. V-min is a ligand-binding variable domain which comprises a framework region of a cyclically permuted central betabarrel, outer beta-sheet segments, and linker segments, and

```
A fragment of the heavy chain (VH + CH1) from the anti-snake small neurotoxin monoclonal antibody M(alpha)2-3 was PCR-amplified from hybridoma-derived CDNA using primers AAQ48043 and AAQ48040. A light chain fragment (VL + CL) was amplified from the same source using primers AAQ48041 and AAQ48042. The two amplified fragments were inserted into the same vector; the H-chain fragment was inserted (in-frame) between codons 6-7 of the phoA coding sequence and the L-chain fragment was inserted into a cassette which contained a phoA 5-D sequence, a signal peptide and the first 6 codons of phoA. The cassette was positioned between the termination codon and the transcription termination sequence of phoA. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New immunoglobulin hybrid proteins - with immunoglobulin fragments linked to dimeric protein, for diagnostic or therapeutic use.

fusion construct is expected to to encode a hybrid protein comprising twidentical Ab-derived units. The invention also covers hybrid proteins containing two different Ab-derived units (i.e. to produce bispecific antibodies). When a toxic protein is used in place of phoA, the hybrid molecules can be used as cell-targetting therapeutic agents. (Updated on 10-MAR-2003 to add missing OS field.) (Updated on 25-MAR-2003 to correct PN field.)

Conjugate for therapy, has bacterial superantigen with a region in T-cell receptor and four regions to determine binding to class II major histocompatibility complex, antibody to cancer associated cell surface
                                                                                                                                                                                               The present sequence is the protein sequence of staphylococcal enterotoxin A (SEA). The invention provides novel conjugates (see ABPS6454) for human cancer therapy. These comprise an engineered bacterial superantigen, such as novel SEA/E-120 (see ABPS6455), and an antibody moiety, such as tumour reactive antibody ST4. Bacterial enterotoxins such as SEA, SEE, SED and SEH were used in the molecular modelling of the engineered superantigens. The superantigens were engineered to reduce seroreactivity whilst maintaining biological activity and production levels. The novel conjugates were designed to target and destroy cancer cells, including cancer of the lung, breast, colon, kidney, pancreas, ovary, stomach, cervix and prostate (claimed)

The present invention relates to peptides which exhibit anti-retroviral activity. The peptides of the invention (AAU12559-AAU14009) comprise corresponds and DP107-like peptides. The DP104 peptide corresponds to amino acids 639-673 of the transmembrane protein gp41 from human immunodeficiency virus I (HIV-1) isolate LAI. The DP107 peptide corresponds to amino acids 558-595 of gp41 from HIV-ILAI. The invention calso relates to a method of identifying compounds that inhibit the corresponds to amino acids 558-595 of gp41 from HIV-ILAI. The invention calso relates to a method of identifying compounds that inhibit the formation of or disrupts a DP107/DP178 complex, both in the presence of absence of a test compound, in a reaction mixture containing DP107 and DP178 peptides. The method is useful for identifying compounds, including small molecule compounds, which may themselves exhibit antifusogenic, attivital or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human retroviral, particularly HIV, transmission to uninfected cells. The present sequence corresponds aureus enterotoxin A
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        EEKKVPINLWLDGKONTVPLETVKTNKKNVTVQELDLQARRYLQEKYNLYNSDVFDGKVQ 204

virus to a cell, comprising contexting the cell with an effective concentration of a peptide consisting of a region of 16-39 consecutive amino acids of an Epstein-Earl virus protein for an effective period of time, where the region is recognisting of a region of 16-39 consecutive time, where the region is recognised by one or more of ALLMOTIS.

107X178x4 or PLZIP sequence search motifs, the peptide further comprises on amino terminal X, and a carboxy terminal Z in which X comprises amino group, acetyl group, 9-fluorenylmethoxy-carbonyl group, hydrophobic group, or macromolecular carrier group, and Z comprises a carboxyl group, cusion of the virus to the cell is inhibited. The peptides were identified by analysing the structure/mocifs present in the HIV-12 dentificated by analysing the structure/mocifs present in the HIV-12 dentificated and the action of motif containing peptides were used to design the motifs cited above, which in turn were used to analyse proteins from other pathogenic organisms and HIV isolates, looking for D0107/178 structural analogues. The method is useful for inhibiting transmission of Epstein-Barr virus to protein from a pathogenic organism analysed for regions analogous to D0107 or D0107 or D0107
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ..

The invention relates to novel oligonucleotide primers directed against enterotoxin A gene (ent A) of Staphylococcus aureus and heat stable enterotoxin gene (yst) of bacteria Yersinia enterocolitica. The novel oligonucleotide primers are useful for simultaneously detecting food poisoning bacterial species Staphylococcus aureus and/or Yersinia enterocolitica in food systems e.g., milk, fruit juices and ice creams, without prior enrichment for preventing food poisoning outbreak. The PCR detection method is useful for detecting the bacteria strains in quantity as low as one cell. The method can be directly used for detecting bacterial strains. The oligonucleotide primers allow quick and highly sensitive detection of the food poisoning bacterial species. This sequence represents the protein derived from the enterotoxin A gene from Staphylococcus aureus of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       286 HPWYNDLLVDLGSTAATSEYEGSSVDLYGAYYGYQCAGGTPNKTACMYGGVTLHDNNRLT 345

The present invention describes a polypeptide sequence compitating part of all of the primary structural conformation of one or more thyrotropin of produced in response to a TSH receptor interact. Also described: (1) one produced in response to a TSH receptor interact. Also described: (1) one or more receptor TSH epitopes with which the autoantibodies and/or produced in response to a TSH receptor in a sample of body fluid obtained from a response to a TSH receptor in a sample of body fluid obtained from a capping to a TSH receptor in a sample of body fluid obtained from a complect suspected of suffering from, susceptible to, having or recovering from autoimmune disease associated with an immune reaction to a TSH receptor; (3) a binding partner for a TSH receptor, which is capable of binding to a TSH receptor to stimulate the TSH receptor, where the companing partner does not comprise TSH or naturally produced antibodies to the TSH receptor; and (4) a combination comprising the binding partner of and/or tissue containing a TSH receptor, for simulating thyroid tissue, and/or tissue containing a TSH receptor, for simulating thyroid tissue, and/or tissue containing a TSH receptor, for simulating thyroid cancer.

TSH receptor A TSH receptor has cytostatic activity and can be used in for the manufacture of a medicament for tissue containing a TSH receptor. The specific binding partner is useful for the manufacture of a medicament for stimulating thyroid cancer.

ACC44874 to ACC44906 and ABP96719 to ABP96750 represent TSH receptor antibody VH cand and VI domains given in ACC44913 encoded the TSH receptor antibody we candinate and ACC44910 to ACC44933 encode the TSH receptor antibody we candinate and ACC44910 to ACC44933 encode the TSH receptor antibody we candinate given in ACC44910 to ACC44933 encode the TSH receptor and the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New polypeptide sequence having part or all of the primary structural conformation of one or more TSH receptor epitopes, useful for treating an autoimmune disease associated with an immune reaction to a TSH receptor,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  present invention describes a polypeptide sequence comprising part or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New purified antibody that specifically binds a TNF-related apoptosis-
inducing ligand receptor DR4 or DR5, useful for treating cancer,
inflammatory disease or autoimmune disease in a subject, e.g. asthma or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to an antibody that specifically binds a tumour necrosis factor (TNF)-related apoptosis-inducing ligand (TRALL) recepto DRA or DRS. Antibodies of the invention are useful for selectively inducing apoptosis in target cells expressing DRA, for inhibiting proliferation of target cells expressing DRA or for treating cancer, inflammatory disease or autoimmune disease in a subject e.g. systemic lupus erythematosus, Hashimoto's disease, rheumatoid arthritis, graft-versus-host disease, Godpasture's syndrome, Crohn's disease, multiple sclerosis, diaberes mellitus, allergy, asthma, arteriosclerosis or antibody (TRA-8) light chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          132 APTVSIFPPSSEQLISGGASVVCFLNNFYPKDINVKWKIDGSERQNGVLNSWTDQDSKDS

The present invention describes a polypeptide sequence comprising part or all of the primary structural conformation of one or more thyrotropin (TSH) receptor entitle autoantibodies and/or lymphocytes produced in response to a TSH receptor interact. Also described above; cor more receptor TSH epitopes with which the autoantibodies and/or lymphocytes interact. As with the polypeptide sequence described above; cor more receptor TSH epitopes with which the autoantibodies and/or lymphocytes produced in seaponse to a TSH receptor in a sample of body fluid obtained from a response to a TSH receptor in a sample of body fluid obtained from a subject suspected of suffering from, susceptible to, having or recovering from autoimmune disease associated with an immine reaction to a TSH receptor (3) a binding partner for a TSH receptor, which is capable of binding partner does not comprise TSH or naturally produced antibodies to binding partner does not comprise TSH or naturally produced antibodies to the TSH receptor; and (4) a combination comprising the binding partner agents capable of stimulating thyroid tissue.

Cond one or more further agents capable of stimulating thyroid tissue, and not rissue containing a TSH receptor, for simulatines or sequential use in stimulating thyroid tissue, and/or tissue containing a TSH receptor. The specific binding partner is useful for the manufacture of a medicament for stimulating thyroid cissue containing a TSH receptor; neeptor. The specific binding partner is useful for the manufacture of a medicament for stimulating thyroid cissue or tissue containing a TSH receptor, and for treating an autoimmune disease associated with an immune reaction to a TSH receptor. The specific binding partner is useful for the manufacture of a medicament for stimulating thyroid cissue or tissue containing a TSH receptor, and for treating and appsyforty to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC44910 to ACC449

           MAD 55.1 (ECACC 93081901) recognises the colorectal tumor-associated antigen CA55.1. cDNAs for the heavy (AAQ94037) and light (AAQ94036) chains of 55.1 were isolated, and F(ab), 'F(ab)2. Fab, Fv, scFv or V-min humanized 55.1 constructs have been expressed in myeloma cells and B. coli. (Updated on 25-MAR-2003 to correct PN field.)

ö
with cytokine or chemokine nucleic acids, is delivered to an animal using e.g. liposomes. It acts by controlling the activity of effector cells, each as T-cells, macrophages, monocytes and/or natural killer cells. Localised prodn. of an effective but non-toxic amount of encoded proteins allows safe treatment of the animal

This SEA superantigen can be modified to be used in a movel conjugate. The novel conjugate compuses a target seeking moiety and a modified wild type superantigen. The modified superantigen retains its ability to activate a subset of Tealls, even though in or more wild-type amino acid residues in at least I region which functions in determining binding to cell receptor (TCR) and activation of a subset of T cells has/have been replaced. Such a modified superantigen can optionally be used as part of a conjugate with a target seeking moiety, for activating the immune system to treat a mammalian disease. A pharmaceutical composition can be
                                                                                                                                                                                                                                                                                                                                                                    61

ö
prepared comprising a modified antibody (preferably a Fab fragment fused to a peptide moiety providing activation of T cells in Wheta specific manner) in which cysteines providing for interchain cysteine linkages in the native antibody have been replaced (preferably by serine residues) to prohibit cysteine formation. The modified wild-type superantigen is used for treating cancer, viral infections, parasitic infestations and autoimmune disease. The modified wild type superantigen has a lower immunogenicity and reactivity with neutralising antibodies and has fewer side-effects when used as a drug, compared to wild type superantigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumor cell capable of stimulating antitumor immune reactivity in vitro or in vivo comprises exogenous nucleic acids encoding a superantigen and a
                                                                                                                                                                                                                                                                 345

The present invention relates to a tumour cell capable of stimulating antitumor immune reactivity in vitro or in in vivo contains and expresses an exogenous nucleic acid molecule encoding a superantigen or its active fragment and an exogenous nucleic acid molecule encoding a costimulatory molecule that activates T cells in conjunction with an antigenic stimulus. The invention may be used for cancer therapy by stimulating an anticancer immune response in vivo or ex vivo
                                                                                                                                                                                                          285

Description of the property of the property of the property of a cell expressing DRS in vivo. It is also useful for preparing a therapeutic for selective apoptosis of abnormal or dysregulated cells, and for inhibiting cell proliferation in a cell, preferably a human breast, ovary, colon, haematopoietic, prostate, lympharic, lung, glioma or liver cancer cell. A therapeutic agent may also be administered e.g. paclitaxel, taxol or cyclohaximide. The antibody is used to treat an autoimmune disease, systemic lupus crythematosus. Hashimoto's disease, rheumatoid arthritis, graft-versus-host disease, sjogren's syndrome, chron's disease, pernicious anaemia, Addison disease, scleroderma, Goodpasture's syndrome, autoimmune haeman's careformine sterility, myasthenia gravis, multiple sclerosis, haemolykic anaemia, sterility, myasthenia gravis, multiple sclerosis, clisease, insulin-dependent diabetes mellitus, allergy, atopic disease, arteriosclerosis, myocarditis, cardiomyopathy, glomerular nephritis, hypoplastic anaemia, rejection after organ transplantation, breast tissue Peptides used to design primers for isolating heavy and clistic chain coll, of the mouse TRAIL (AAU72801 and AAU72802), TRA-8 are necrosis factor (TNF)-related apoptosis-inducing ligand (TRAIL) receptor DRS (located on chromosome Revi-70) The contract of t light chain cDNA of the mouse Shown in AAU72799 and AAU72800 8888888888888888888888888888888

(TERM/) TERMAN D S.

Terman DS;

The invention relates to a mammalian cell receptor, useful in the treatment of cancer, which binds to tunnour associated lipids and induces an amergy or apoptoeis in the T cells and antigno presenting cells (APCS).

Also included are a mammalian cell useful in the treatment of cancer where the receptor which binds tunnour associated lipids and induces cellular inactivation or death is deleted by incritionally descrivated, producing (MI) a tunnouricidal immuncyte population in vivo in a mammal control in proving tunnour associated lipids, corranides, glycosphingolipids, prophosphospholipids, prophospholipids, prophospholipids, prophospholipids, and proteoglycolipids are inactivated or superantiges (SpA) mucleoside inserted into a vivus, a mammalian testing tunnour associated lipids to contact immuncytes profession which cancer (comprising a lipid rate conjugated to a superantigen, producing (MI) a tunnouricidal immuncytes population useful in the treatment of cancer (where an adaptor process with the treatment of cancer (where an adaptor process with the treatment of cancer (where an adaptor process with the treatment of cancer (comprising a lipid rate conjugated to a superantigan), producing (MI) a tunnouricidal in an ammmal (WI) attenticidal immuncytes population, and administering the tunnouricidal in the treatment of cancer (tomprised and administering associated lipids are inactivated or deleted to produce a tunnouricidal and administering the tunnouricidal and administering the tunnouricidal and administering the tunnouricidal and administering the tunnouricidal and administering the tunnouricidal and administering the tunnouricidal and administering a superantigen-lipid after conjugate to contact T cells to the lost, or administering the tunnouricidal and administering a superantigen-lipid and compositions are celleted or functionally descrivated in population in a vivo in a mammal lipid administering a superantigen to contact immunocytes in which administering a superantigen-lipid and compositions are us A mammalian cell receptor, useful in the treatment of cancer by binding to tumor associated lipids where the binding induces anergy or apoptosis cells and antigen presenting cells.
